Abstract

We prove some existence (and sometimes also uniqueness) of solutions to some stationary equations associated to the complex Schrödinger operator under the presence of a singular nonlinear term. Among other new facts, with respect some previous results in the literature for such type of nonlinear potential terms, we include the case in which the spatial domain is possibly unbounded (something which is connected with some previous localization results by the authors), the presence of possible non-local terms at the equation, the case of boundary conditions different to the Dirichlet ones and, finally, the proof of the existence of solutions when the right-hand side term of the equation is beyond the usual L^2 -space.

1 Introduction

This paper is concerned by existence of solutions for two kinds of equations related to the complex Schrödinger operator,

$$-\Delta u + a|u|^{-(1-m)}u + bu = F, \text{ in } L^2(\Omega), \quad (1.1)$$

$$-\Delta u + a|u|^{-(1-m)}u + bu + cV^2u = F, \text{ in } L^2(\Omega), \quad (1.2)$$

with homogeneous Dirichlet boundary condition

$$u|_{\Gamma} = 0, \quad (1.3)$$

or homogeneous Neumann boundary condition

$$\frac{\partial u}{\partial \nu}|_{\Gamma} = 0, \quad (1.4)$$

where Ω is a subset of \mathbb{R}^N with boundary Γ , $0 < m < 1$, $(a, b, c) \in \mathbb{C}^3$ and $V \in L^\infty(\Omega; \mathbb{R})$ is a real potential. Here and in what follows, when Γ is of class C^1 , ν denotes the outward unit normal vector to Γ . Moreover, $\Delta = \sum_{j=1}^N \frac{\partial^2}{\partial x_j^2}$ is the Laplacian in Ω .

In Bégout and Díaz [1], the authors study the spatial localization property compactness of the support of solutions of equation (1.1) (see Theorems 3.1, 3.5, 3.6, 4.1, 4.4 and 5.2). Existence, uniqueness and *a priori* bound are also established with the homogeneous Dirichlet boundary condition, $F \in L^p(\Omega)$ ($2 < p < \infty$) and $(a, b) \in \mathbb{C}^2$ satisfying assumptions (2.7) below. In this paper, we give such existence and *a priori* bound results but for the weaker assumption $F \in L^2(\Omega)$ (Theorems 2.8 and 2.9) and also for some different hypotheses on $(a, b) \in \mathbb{C}^2$ (Theorems 2.1 and 2.3). Additionally, we consider homogeneous Neumann boundary condition (Theorems 2.8 and 2.9).

In Bégout and Díaz [2], spatial localization property for the partial differential equation (1.2) associated to self-similar solutions of the nonlinear Schrödinger equation

$$iu_t + \Delta u = a|u|^{-(1-m)}u + f(t, x),$$

is studied.

In this paper, we prove existence of solutions with homogeneous Dirichlet or Neumann boundary conditions (Theorems 2.4) and establish *a priori* bounds (Theorem 2.6), for both equations (1.1) and (1.2) with any of both boundary conditions (1.3) or (1.4). We also show uniqueness (Theorem 2.10) and regularity results (Theorem 2.12), under suitable additional conditions. We send the reader to the long introduction of Bégout and Díaz [2] for many comments on the frameworks in which the equation arises (Quantum Mechanics, Nonlinear Optics and Hydrodynamics) and their connections with some other papers in the literature.

This paper is organized as follows. In the next section, we give results about existence, uniqueness, regularity and *a priori* bounds for equations (1.1) and (1.2), with boundary conditions (1.3) or (1.4), and notations are given in Section 3. Section 4, is devoted to the establishment of *a priori* bounds for the different truncated nonlinearities of equations studied in this paper. In Section 5, we prove the results given in Section 2. In Bégout and Díaz [1], localization property is studied for equation (1.1). The results we give require, sometimes, the same assumptions on $(a, b) \in \mathbb{C}^2$ as in Bégout and Díaz [1] but with a change of notation. See Comments 2.7 below for the motivation of this change. In Section 6 we will show the existence of solutions to equation (1.2) for data in a weighted subspace. Finally, in the last section, we state the principal results obtained in this paper and give some applications. Existence of solutions for equation (1.2) is used in Bégout and Díaz [2] while existence of solutions for equation (1.1) is used in Bégout and Díaz [3].

2 Main results

Here, we state the main results of this paper.

Theorem 2.1 (Existence). *Let Ω an open subset of \mathbb{R}^N be such that $|\Omega| < \infty$ and assume $0 < m < 1$, $(a, b) \in \mathbb{C}^2$ and $F \in L^2(\Omega)$. If $\operatorname{Re}(b) < 0$ then assume further that $\operatorname{Im}(b) \neq 0$ or $-\frac{1}{C_{\mathbb{P}}^2} < \operatorname{Re}(b)$, where $C_{\mathbb{P}}$ is the Poincaré's constant in (4.1) below. Then there exists at least a solution $u \in H_0^1(\Omega)$ of (1.1). In addition, Symmetry Property 2.2 below holds.*

Symmetry Property 2.2. *If furthermore, for any $\mathcal{R} \in SO_N(\mathbb{R})$, $\mathcal{R}\Omega = \Omega$ and if F is spherically symmetric then we may construct a solution which is additionally spherically symmetric. For $N = 1$, this means that if F is an even (respectively, an odd) function then u is also an even (respectively, an odd) function.*

Theorem 2.3 (A priori bound). *Let Ω an open subset of \mathbb{R}^N be such that $|\Omega| < \infty$ and assume $0 < m < 1$, $(a, b) \in \mathbb{C}^2$ and $F \in L^2(\Omega)$. If $\operatorname{Re}(b) < 0$ then assume further that $\operatorname{Im}(b) \neq 0$ or*

$-\frac{1}{C_{\mathbb{P}}^2} < \operatorname{Re}(b)$, where $C_{\mathbb{P}}$ is the constant in (4.1) below. Let $u \in H_0^1(\Omega)$ be any solution to (1.1). Then we have the following estimate.

$$\|u\|_{H_0^1(\Omega)} \leq C,$$

where $C = C(\|F\|_{L^2(\Omega)}, |\Omega|, |a|, |b|, N, m)$.

Theorem 2.4 (Existence). *Let $\Omega \subseteq \mathbb{R}^N$ be an open subset and assume $V \in L^\infty(\Omega; \mathbb{R})$, $0 < m < 1$, $(a, b, c) \in \mathbb{C}^3$ is such that $\operatorname{Im}(a) \leq 0$, $\operatorname{Im}(b) < 0$ and $\operatorname{Im}(c) \leq 0$. If $\operatorname{Re}(a) \leq 0$ then assume further that $\operatorname{Im}(a) < 0$. Then we have the following result.*

- 1) For any $F \in L^2(\Omega)$, there exists at least a solution $u \in H_0^1(\Omega) \cap L^{m+1}(\Omega)$ to (1.2).
- 2) If we assume furthermore that Ω is bounded with a C^1 boundary then the conclusion 1) still holds true with $u \in H^1(\Omega)$ and the boundary condition (1.4) instead of $u \in H_0^1(\Omega)$.

If, in addition, V is spherically symmetric then Symmetry Property 2.2 holds.

Remark 2.5. Here are some comments about boundary condition.

- 1) If $u \notin C(\overline{\Omega})$ and Ω has not a $C^{0,1}$ boundary, the condition $u|_{\Gamma} = 0$ does not make sense (in the sense of the trace) and, in this case, has to be understood as $u \in H_0^1(\Omega)$.
- 2) Assume that Ω is bounded and has a $C^{1,1}$ boundary. Let $u \in H^1(\Omega)$ be any solution to (1.2) with the boundary condition (1.4). Then $u \in H^2(\Omega)$ and boundary condition $\frac{\partial u}{\partial \nu}|_{\Gamma} = 0$ makes sense in the sense of the trace $\gamma(\nabla u \cdot \nu) = 0$. If, in addition, $u \in C^1(\overline{\Omega})$ then obviously for any $x \in \Gamma$, $\frac{\partial u}{\partial \nu}(x) = 0$. Indeed, since $u \in H^1(\Omega)$, $\Delta u \in L^2(\Omega)$ and (1.2) makes sense almost everywhere in Ω , we have $\gamma\left(\frac{\partial u}{\partial \nu}\right) \in H^{-\frac{1}{2}}(\Gamma)$ and by Green's formula,

$$\begin{aligned} \operatorname{Re} \int_{\Omega} \nabla u(x) \cdot \overline{\nabla v(x)} dx - \left\langle \gamma\left(\frac{\partial u}{\partial \nu}\right), \gamma(v) \right\rangle_{H^{-\frac{1}{2}}(\Gamma), H^{\frac{1}{2}}(\Gamma)} \\ + \operatorname{Re} \int_{\Omega} f(u(x)) \overline{v(x)} dx = \operatorname{Re} \int_{\Omega} F(x) \overline{v(x)} dx, \end{aligned} \quad (2.1)$$

for any $v \in H^1(\Omega)$, where $f u = a|u|^{-(1-m)}u + bu + cV^2u$. (see Lemma 4.1, Theorem 4.2 and Corollary 4.1, p.155, in Lions and Magenes [17] and (1,5,3,10) in Grisvard [11], p.62). This implies that

$$\left\langle \gamma\left(\frac{\partial u}{\partial \nu}\right), \gamma(v) \right\rangle_{H^{-\frac{1}{2}}(\Gamma), H^{\frac{1}{2}}(\Gamma)} = 0, \quad (2.2)$$

for any $v \in H^1(\Omega)$. Let $w \in H^{\frac{1}{2}}(\Gamma)$. Let $v \in H^1(\Omega)$ be such that $\gamma(v) = w$ (Theorem 1.5.1.3, p.38, in Grisvard [11]). We then deduce from (2.2) that,

$$\forall w \in H^{\frac{1}{2}}(\Gamma), \left\langle \gamma \left(\frac{\partial u}{\partial \nu} \right), w \right\rangle_{H^{-\frac{1}{2}}(\Gamma), H^{\frac{1}{2}}(\Gamma)} = 0,$$

and so $\gamma \left(\frac{\partial u}{\partial \nu} \right) = 0$. But also $u \in L^2(\Omega)$ and $\Delta u \in L^2(\Omega)$. It follows that $u \in H^2(\Omega)$ (Proposition 2.5.2.3, p.131, in Grisvard [11]). Hence the result.

Theorem 2.6 (A priori bound). *Let $\Omega \subseteq \mathbb{R}^N$ be an open subset, let $V \in L^\infty(\Omega; \mathbb{R})$, let $0 < m < 1$, let $(a, b, c) \in \mathbb{C}^3$ be such that $\text{Im}(a) \leq 0$, $\text{Im}(b) < 0$ and $\text{Im}(c) \leq 0$. If $\text{Re}(a) \leq 0$ then assume further that $\text{Im}(a) < 0$. Let $F \in L^2(\Omega)$ and let $u \in H^1(\Omega)$ be any solution to (1.2) with boundary condition (1.3) or (1.4)¹. Then we have the following estimate.*

$$\|u\|_{H^1(\Omega)}^2 + \|u\|_{L^{m+1}(\Omega)}^{m+1} \leq M(\|V\|_{L^\infty(\Omega)}^4 + 1)\|F\|_{L^2(\Omega)}^2,$$

where $M = M(|a|, |b|, |c|)$.

Comments 2.7. In the context of the paper of Bégout and Díaz [1], we can establish an existence result with the homogeneous Neumann boundary condition (instead of the homogeneous Dirichlet condition) and $F \in L^2(\Omega)$ (instead of $F \in L^{\frac{m+1}{m}}(\Omega)$). In Bégout and Díaz [1], we introduced the set,

$$\tilde{\mathbb{A}} = \mathbb{C} \setminus \{z \in \mathbb{C}; \text{Re}(z) = 0 \text{ and } \text{Im}(z) \leq 0\},$$

and assumed that $(\tilde{a}, \tilde{b}) \in \mathbb{C}^2$ satisfies,

$$(\tilde{a}, \tilde{b}) \in \tilde{\mathbb{A}} \times \tilde{\mathbb{A}} \quad \text{and} \quad \begin{cases} \text{Re}(\tilde{a})\text{Re}(\tilde{b}) \geq 0, \\ \text{or} \\ \text{Re}(\tilde{a})\text{Re}(\tilde{b}) < 0 \text{ and } \text{Im}(\tilde{b}) > \frac{\text{Re}(\tilde{b})}{\text{Re}(\tilde{a})}\text{Im}(\tilde{a}), \end{cases} \quad (2.3)$$

with possibly $\tilde{b} = 0$, and we worked with

$$-i\Delta u + \tilde{a}|u|^{-(1-m)}u + \tilde{b}u = \tilde{F}.$$

Nevertheless, to maintain a closer notation to many applied works in the literature (see, e.g., the introduction of Bégout and Díaz [2]), we do not work any more with this equation but with,

$$-\Delta u + a|u|^{-(1-m)}u + bu = F,$$

¹for which we additionally assume that Ω has a C^1 boundary.

and $b \neq 0$. This means that we chose, $\tilde{a} = ia$, $\tilde{b} = ib$ and $\tilde{F} = iF$. Then assumptions on (a, b) are changed by the fact that for $\tilde{z} = iz$,

$$\operatorname{Re}(z) = \operatorname{Re}(-i\tilde{z}) = \operatorname{Im}(\tilde{z}), \quad (2.4)$$

$$\operatorname{Im}(z) = \operatorname{Im}(-i\tilde{z}) = -\operatorname{Re}(\tilde{z}). \quad (2.5)$$

It follows that the set $\tilde{\mathbb{A}}$ and (2.3) become,

$$\mathbb{A} = \mathbb{C} \setminus \{z \in \mathbb{C}; \operatorname{Re}(z) \leq 0 \text{ and } \operatorname{Im}(z) = 0\}, \quad (2.6)$$

$$(a, b) \in \mathbb{A} \times \mathbb{A} \quad \text{and} \quad \begin{cases} \operatorname{Im}(a)\operatorname{Im}(b) \geq 0, \\ \text{or} \\ \operatorname{Im}(a)\operatorname{Im}(b) < 0 \text{ and } \operatorname{Re}(b) > \frac{\operatorname{Im}(b)}{\operatorname{Im}(a)}\operatorname{Re}(a). \end{cases} \quad (2.7)$$

Obviously,

$$\left((\tilde{a}, \tilde{b}) \in \tilde{\mathbb{A}} \times \tilde{\mathbb{A}} \text{ satisfies (2.3)} \right) \iff \left((a, b) \in \mathbb{A} \times \mathbb{A} \text{ satisfies (2.7)} \right).$$

Assumptions (2.7) are made to prove the existence and the localization property of solutions to equation (1.1). Now, we give some results about equation (1.1) when $(a, b) \in \mathbb{A} \times \mathbb{A}$ satisfies (2.7).

Theorem 2.8 (Existence). *Let $\Omega \subseteq \mathbb{R}^N$ be an open subset of \mathbb{R}^N , let $0 < m < 1$ and let $(a, b) \in \mathbb{A}^2$ satisfies (2.7).*

1) *For any $F \in L^2(\Omega)$, there exists at least a solution $u \in H_0^1(\Omega) \cap L^{m+1}(\Omega)$ to*

$$-\Delta u + a|u|^{-(1-m)}u + bu = F, \text{ in } L^2(\Omega) + L^{\frac{m+1}{m}}(\Omega). \quad (2.8)$$

2) *If we assume furthermore that Ω is bounded with a C^1 boundary then the conclusion 1) still holds true with $u \in H^1(\Omega)$ and the boundary condition (1.4) instead of $u \in H_0^1(\Omega)$.*

In addition, Symmetry Property 2.2 holds.

Theorem 2.9 (A priori bound). *Let $\Omega \subseteq \mathbb{R}^N$ be an open subset of \mathbb{R}^N , let $0 < m < 1$ and let $(a, b) \in \mathbb{A}^2$ satisfies (2.7). Let $F \in L^2(\Omega)$ and let $u \in H^1(\Omega) \cap L^{m+1}(\Omega)$ be any solution to (2.8) with boundary condition (1.3) or (1.4)¹. Then we have the following estimate.*

$$\|u\|_{H^1(\Omega)}^2 + \|u\|_{L^{m+1}(\Omega)}^{m+1} \leq M \|F\|_{L^2(\Omega)}^2,$$

where $M = M(|a|, |b|)$.

Theorem 2.10 (Uniqueness). *Let $\Omega \subseteq \mathbb{R}^N$ be an open subset, let $V \in L_{\text{loc}}^\infty(\Omega; \mathbb{R})$, let $0 < m < 1$ and let $(a, b, c) \in \mathbb{C}^3$ satisfies one of the three following conditions.*

- 1) $a \neq 0$, $\text{Re}(a) \geq 0$, $\text{Re}(a\bar{b}) \geq 0$ and $\text{Re}(a\bar{c}) \geq 0$.
- 2) $b \neq 0$, $\text{Re}(b) \geq 0$, $a = kb$, for some $k \geq 0$ and $\text{Re}(b\bar{c}) \geq 0$.
- 3) $c \neq 0$, $\text{Re}(c) \geq 0$, $a = kc$, for some $k > 0$ and $\text{Re}(b\bar{c}) \geq 0$.

Let $F \in L_{\text{loc}}^1(\Omega)$. If there exist two solutions $u_1, u_2 \in H^1(\Omega) \cap L^{m+1}(\Omega)$ of (1.2) with the same boundary condition (1.3) or (1.4)¹ such that $Vu_1, Vu_2 \in L^2(\Omega)$ then $u_1 = u_2$.

Remark 2.11. Here are some comments about Theorems 2.1, 2.4, 2.8 and 2.10.

- 1) Assume F is spherically symmetric. Since we do not know, in general, if we have uniqueness of the solution, we are not able to show that any solution is radially symmetric.
- 2) In Theorem 5.2 in Bégout and Díaz [1], uniqueness for equation

$$-i\Delta u + \tilde{a}|u|^{-(1-m)}u + \tilde{b}u = \tilde{F},$$

holds if $\tilde{a} \neq 0$, $\text{Im}(\tilde{a}) \geq 0$ and $\text{Re}(\tilde{a}\bar{\tilde{b}}) \geq 0$. By (2.4)–(2.5), those assumptions are equivalent to 1) of Theorem 2.10 above for equation (1.1) (of course, $c = 0$). It follows that Theorem 2.10 above extends Theorem 5.2 of Bégout and Díaz [1].

- 3) In 2) of the above theorem, if we want to make an analogy with 1), assumption $a = kb$, for some $k \geq 0$ has to be replaced with $\text{Re}(a\bar{b}) \geq 0$ and $\text{Im}(a\bar{b}) = 0$. But,

$$\left(\text{Re}(a\bar{b}) \geq 0 \text{ and } \text{Im}(a\bar{b}) = 0 \right) \iff \left(\exists k \geq 0 / a = kb \right).$$

In the same way,

$$\left(\text{Re}(a\bar{c}) > 0 \text{ and } \text{Im}(a\bar{c}) = 0 \right) \iff \left(\exists k > 0 / a = kc \right).$$

- 4) In the case of real solutions (with $F \equiv 0$ and $(a, b, c) \in \mathbb{R} \times \mathbb{R} \times \{0\}$), it is well-known that if $b < 0$ then it may appear multiplicity of solutions (once $m \in (0, 1)$ and $a > 0$). For more details, see Theorem 1 in Díaz and Hernández [7].

Theorem 2.12 (Regularity). *Let $\Omega \subseteq \mathbb{R}^N$ be an open subset, let $V \in L_{\text{loc}}^r(\Omega; \mathbb{C})$, for any $1 < r < \infty$, let $0 < m < 1$, let $(a, b) \in \mathbb{C}^2$, let $F \in L_{\text{loc}}^1(\Omega)$, let $1 < q < \infty$ and let $u \in L_{\text{loc}}^q(\Omega)$ be any local solution to*

$$-\Delta u + a|u|^{-(1-m)}u + Vu = F, \text{ in } \mathcal{D}'(\Omega). \quad (2.9)$$

Let $q \leq p < \infty$ and let $\alpha \in (0, m]$.

- 1) If $F \in L^p_{\text{loc}}(\Omega)$ then $u \in W^{2,p}_{\text{loc}}(\Omega)$. If $(F, V) \in C^{0,\alpha}_{\text{loc}}(\Omega) \times C^{0,\alpha}_{\text{loc}}(\Omega)$ then $u \in C^{2,\alpha}_{\text{loc}}(\Omega)$.
- 2) Assume further that Ω is bounded with a $C^{1,1}$ boundary, $F \in L^p(\Omega)$, $V \in L^r(\Omega; \mathbb{C})$, for any $1 < r < \infty$, $u \in L^q(\Omega)$ and $\gamma(u) = 0$. Then $u \in W^{2,p}(\Omega) \cap W^{1,p}_0(\Omega)$. If $(F, V) \in C^{0,\alpha}(\overline{\Omega}) \times C^{0,\alpha}(\overline{\Omega})$ then $u \in C^{2,\alpha}(\overline{\Omega}) \cap C_0(\Omega)$.
- 3) Assume further that Ω is bounded with a $C^{1,1}$ boundary, $F \in L^p(\Omega)$, $V \in L^r(\Omega; \mathbb{C})$, for any $1 < r < \infty$, $u \in L^q(\Omega)$ and $\gamma(\frac{\partial u}{\partial \nu}) = 0$. Then $u \in W^{2,p}(\Omega)$. If $(F, V) \in C^{0,\alpha}(\overline{\Omega}) \times C^{0,\alpha}(\overline{\Omega})$ then $u \in C^{2,\alpha}(\overline{\Omega})$ and for any $x \in \Gamma$, $\frac{\partial u}{\partial \nu}(x) = 0$.

Remark 2.13. Assume Ω is bounded and has a $C^{1,1}$ boundary. Let $V \in \bigcap_{1 < r < \infty} L^r(\Omega; \mathbb{C})$, $0 < m < 1$, $(a, b) \in \mathbb{C}^2$, $1 < q \leq p < \infty$, $F \in L^p(\Omega)$ and let $u \in L^q(\Omega)$ be any solution to (2.9). Let $T : u \rightarrow \{\gamma(u), \gamma(\frac{\partial u}{\partial \nu})\}$ be the trace function defined on $\mathcal{D}(\overline{\Omega})$. By density of $\mathcal{D}(\overline{\Omega})$ in $D_q(\Delta) \stackrel{\text{def}}{=} \{u \in L^q(\Omega); \Delta u \in L^q(\Omega)\}$, T has a linear and continuous extension from $D_q(\Delta)$ into $W^{-\frac{1}{q},q}(\Gamma) \times W^{-1-\frac{1}{q},q}(\Gamma)$ (Hörmander [12], Theorem 2 p.503; Lions and Magenes [17], Lemma 2.2 and Theorem 2.1 p.147; Lions and Magenes [18], Propositions 9.1, Proposition 9.2 and Theorem 9.1 p.82; Grisvard [11], p.54). Since $u \in L^q(\Omega)$, it follows from equation (2.9) and Hölder's inequality that $u \in D_q(\Delta)$, so that “ $\gamma(u) = 0$ ” and “ $\gamma(\frac{\partial u}{\partial \nu}) = 0$ ” make sense.

The main difficulty to apply Theorem 2.12 is to show that such a solution of (2.9) verifies some boundary condition. In the following result, we give a sufficient condition.

Proposition 2.14 (Regularity). *Let Ω be a bounded open subset of \mathbb{R}^N with a $C^{1,1}$ boundary, let $V \in L^N(\Omega; \mathbb{C})$ ($V \in L^{2+\varepsilon}(\Omega; \mathbb{C})$, for some $\varepsilon > 0$, if $N = 2$ and $V \in L^2(\Omega; \mathbb{C})$ if $N = 1$), let $0 < m < 1$, let $a \in \mathbb{C}$ and let $F \in L^2(\Omega)$.*

- 1) Let $u \in H^1_0(\Omega)$ be any solution to (2.9). Then $u \in H^2(\Omega)$ and $\gamma(u) = 0$.
- 2) Let $u \in H^1(\Omega)$ be any solution to (2.9) and (1.4). Then $u \in H^2(\Omega)$ and $\gamma(\frac{\partial u}{\partial \nu}) = 0$.

Remark 2.15. Any solution given by Theorems 2.1, 2.4 or 2.8 belongs to $H^2_{\text{loc}}(\Omega)$ (Theorem 2.12).

3 Notations

We indicate here some of the notations used throughout this paper which have not been defined yet in the introduction (Section 1). We write $i^2 = -1$. We denote by \bar{z} the conjugate of the complex number z , $\text{Re}(z)$ its real part and $\text{Im}(z)$ its imaginary part. For $1 \leq p \leq \infty$, p' is the conjugate of p defined by $\frac{1}{p} + \frac{1}{p'} = 1$. The symbol Ω always indicates a nonempty open subset of \mathbb{R}^N (bounded or not); its closure is denoted by $\overline{\Omega}$ and its boundary by Γ . For $A \in \{\Omega; \overline{\Omega}\}$, the space $C(A) = C^0(A)$

is the set of continuous functions from A to \mathbb{C} and $C^k(A)$ ($k \in \mathbb{N}$) is the space of functions lying in $C(A)$ and having all derivatives of order lesser or equal than k belonging to $C(A)$. For $0 < \alpha \leq 1$ and $k \in \mathbb{N}_0 \stackrel{\text{def}}{=} \mathbb{N} \cup \{0\}$, $C_{\text{loc}}^{k,\alpha}(\Omega) = \left\{ u \in C^k(\Omega); \forall \omega \Subset \Omega, \sum_{|\beta|=k} H_\omega^\alpha(D^\beta u) < +\infty \right\}$, where $H_\omega^\alpha(u) = \sup_{\substack{(x,y) \in \omega^2 \\ x \neq y}} \frac{|u(x)-u(y)|}{|x-y|^\alpha}$. The notation $\omega \Subset \Omega$ means that ω is a bounded open subset of \mathbb{R}^N and $\bar{\omega} \subset \Omega$. In

the same way, $C^{k,\alpha}(\bar{\Omega}) = \left\{ u \in C^k(\bar{\Omega}); \sum_{|\beta|=k} H_\Omega^\alpha(D^\beta u) < +\infty \right\}$. The space $C_0(\Omega)$ consists of functions belonging to $C(\bar{\Omega})$ and vanishing at the boundary Γ , $\mathcal{D}(\Omega)$ is the space of C^∞ functions with compact support and $\mathcal{D}(\bar{\Omega})$ is the restriction to $\bar{\Omega}$ of functions lying in $\mathcal{D}(\mathbb{R}^N)$. The trace function defined on $\mathcal{D}(\bar{\Omega})$ is denoted by γ . For $1 \leq p \leq \infty$ and $m \in \mathbb{N}$, the usual Lebesgue and Sobolev spaces are respectively denoted by $L^p(\Omega)$ and $W^{m,p}(\Omega)$, $W_0^{m,p}(\Omega)$ is the closure of $\mathcal{D}(\Omega)$ under the $W^{m,p}$ -norm, $H^m(\Omega) = W^{m,2}(\Omega)$ and $H_0^m(\Omega) = W_0^{m,2}(\Omega)$. For a Banach space E , its topological dual is denoted by E^* and $\langle \cdot, \cdot \rangle_{E^*,E} \in \mathbb{R}$ is the $E^* - E$ duality product. In particular, for any $T \in L^{p'}(\Omega)$ and $\varphi \in L^p(\Omega)$ with $1 \leq p < \infty$, $\langle T, \varphi \rangle_{L^{p'}(\Omega), L^p(\Omega)} = \text{Re} \int_\Omega T(x) \overline{\varphi(x)} dx$. We write, $W^{-m,p'}(\Omega) = (W_0^{m,p}(\Omega))^*$ ($p < \infty$) and $H^{-m}(\Omega) = (H_0^m(\Omega))^*$. Unless if specified, any function belonging in a functional space ($W^{m,p}(\Omega)$, $C^k(\Omega)$, etc) is supposed to be a complex-valued function ($W^{m,p}(\Omega; \mathbb{C})$, $C^k(\Omega; \mathbb{C})$, etc). We denote by $SO_N(\mathbb{R})$ the special orthogonal group of \mathbb{R}^N . Finally, we denote by C auxiliary positive constants, and sometimes, for positive parameters a_1, \dots, a_n , write $C(a_1, \dots, a_n)$ to indicate that the constant C continuously depends only on a_1, \dots, a_n (this convention also holds for constants which are not denoted by “ C ”).

4 A priori estimates

The proofs of the existence theorems relies on *a priori* bounds, in order to truncate the nonlinearity and pass to the limit. These bounds are formally obtained by multiplying the equation by \bar{u} and $i\bar{u}$, integrate by parts and by making some linear combinations with the obtained results. Now, we recall the well-known Poincaré’s inequality. If $|\Omega| < \infty$ then,

$$\forall u \in H_0^1(\Omega), \|u\|_{L^2(\Omega)} \leq C_P \|\nabla u\|_{L^2(\Omega)}. \quad (4.1)$$

where $C_P = C_P(|\Omega|, N)$. We will frequently use Hölder’s inequality in the following form. If $|\Omega| < \infty$ and $0 \leq m \leq 1$ then $L^2(\Omega) \hookrightarrow L^{m+1}(\Omega)$ and

$$\forall u \in L^2(\Omega), \|u\|_{L^{m+1}(\Omega)}^{m+1} \leq |\Omega|^{\frac{1-m}{2}} \|u\|_{L^2(\Omega)}^{m+1}. \quad (4.2)$$

Finally, we recall the well-known Young's inequality. For any real $x \geq 0$, $y \geq 0$ and $\mu > 0$, one has

$$xy \leq \frac{\mu^2}{2}x^2 + \frac{1}{2\mu^2}y^2. \quad (4.3)$$

Lemma 4.1. *Let Ω an open subset of \mathbb{R}^N be such that $|\Omega| < \infty$, let ω an open subset of \mathbb{R}^N be such that $\omega \subseteq \Omega$, let $0 \leq m \leq 1$, let $(a, b) \in \mathbb{C}^2$, let $\alpha, \beta \geq 0$ and let $F \in L^2(\Omega)$. Let $u \in H_0^1(\Omega)$ satisfies*

$$\begin{aligned} & \left| \|\nabla u\|_{L^2(\Omega)}^2 + \operatorname{Re}(a) \left(\|u\|_{L^{m+1}(\omega)}^{m+1} + \alpha \|u\|_{L^1(\omega^c)} \right) \right. \\ & \quad \left. + \operatorname{Re}(b) \left(\|u\|_{L^2(\omega)}^2 + \beta \|u\|_{L^1(\omega^c)} \right) \right| \leq \int_{\Omega} |Fu| dx, \end{aligned} \quad (4.4)$$

$$\left| \operatorname{Im}(a) \left(\|u\|_{L^{m+1}(\omega)}^{m+1} + \alpha \|u\|_{L^1(\omega^c)} \right) + \operatorname{Im}(b) \left(\|u\|_{L^2(\omega)}^2 + \beta \|u\|_{L^1(\omega^c)} \right) \right| \leq \int_{\Omega} |Fu| dx. \quad (4.5)$$

Here, $\omega^c = \Omega \setminus \omega$. Assume that one of the three following assertions holds.

- 1) $\operatorname{Re}(b) \geq 0$. If $\operatorname{Re}(a) < 0$ and $|\omega| < |\Omega|$ then assume further that $\alpha \|u\|_{L^1(\omega^c)} \leq \|u\|_{L^{m+1}(\omega)}^{m+1}$.
- 2) $\operatorname{Re}(b) < 0$ and $\operatorname{Im}(b) \neq 0$. If $|\omega| < |\Omega|$ then assume further that $\alpha \|u\|_{L^1(\omega^c)} \leq \|u\|_{L^{m+1}(\omega)}^{m+1}$, $F \in L^\infty(\Omega)$ and $-\alpha |\operatorname{Im}(a)| + \frac{\beta}{2} |\operatorname{Im}(b)| > \|F\|_{L^\infty(\Omega)}$.
- 3) $-C_P^{-2} < \operatorname{Re}(b) < 0$, where C_P is the constant in (4.1), $\alpha \|u\|_{L^1(\omega^c)} \leq \|u\|_{L^{m+1}(\omega)}^{m+1}$ and $\beta \|u\|_{L^1(\omega^c)} \leq \|u\|_{L^2(\omega)}^2$.

Then we have the following estimate.

$$\|u\|_{H_0^1(\Omega)} \leq C, \quad (4.6)$$

where $C = C(\|F\|_{L^2(\Omega)}, |\Omega|, |a|, |b|, N, m)$.

Remark 4.2. Obviously, if $|\omega| = |\Omega|$ then $\alpha \|u\|_{L^1(\omega^c)} \leq \|u\|_{L^{m+1}(\omega)}^{m+1}$ and $\beta \|u\|_{L^1(\omega^c)} \leq \|u\|_{L^2(\omega)}^2$.

Proof of Lemma 4.1. By Poincaré's inequality (4.1), it is sufficient to establish

$$\|\nabla u\|_{L^2(\Omega)} \leq C(\|F\|_{L^2(\Omega)}, |\Omega|, |a|, |b|, N, m). \quad (4.7)$$

Moreover, it follows from (4.3) and (4.1) that for any $\mu > 0$,

$$\int_{\Omega} |Fu| dx \leq \frac{C_P^2}{2} \|F\|_{L^2(\Omega)}^2 + \frac{1}{2} \|\nabla u\|_{L^2(\Omega)}^2. \quad (4.8)$$

Finally, it follows from (4.2) and (4.1) that if $\alpha \|u\|_{L^1(\omega^c)} \leq \|u\|_{L^{m+1}(\omega)}^{m+1}$ then one has,

$$\|u\|_{L^{m+1}(\omega)}^{m+1} + \alpha \|u\|_{L^1(\omega^c)} \leq \|u\|_{L^{m+1}(\Omega)}^{m+1} \leq C_P^{m+1} |\Omega|^{\frac{1-m}{2}} \|\nabla u\|_{L^2(\Omega)}^{m+1}. \quad (4.9)$$

We divide the proof in 3 steps.

Step 1. Proof of (4.7) with Assumption 1).

Assume hypothesis 1) holds true. If $\operatorname{Re}(a) \geq 0$ then (4.7) follows from (4.4) and (4.8), while if $\operatorname{Re}(a) < 0$ we then deduce from (4.4), (4.8) and (4.9) that,

$$\left(\|\nabla u\|_{L^2(\Omega)}^{1-m} - |\operatorname{Re}(a)| C_{\mathbb{P}}^{m+1} |\Omega|^{\frac{1-m}{2}} \right) \|\nabla u\|_{L^2(\Omega)}^{m+1} \leq C_{\mathbb{P}}^2 \|F\|_{L^2(\Omega)}^2.$$

Hence (4.7).

Step 2. Proof of (4.7) with Assumption 2).

As for Step 1, it follows from (4.5), (4.2), (4.3) and Hölder's inequality that

$$\begin{aligned} \operatorname{Im}(b) \left(\|u\|_{L^2(\omega)}^2 + \beta \|u\|_{L^1(\omega^c)} \right) &\leq |\operatorname{Im}(a)| |\Omega|^{\frac{1-m}{2}} \|u\|_{L^2(\omega)}^{m+1} + \alpha |\operatorname{Im}(a)| \|u\|_{L^1(\omega^c)} \\ &\quad + \frac{1}{2|\operatorname{Im}(b)|} \|F\|_{L^2(\omega)}^2 + \frac{|\operatorname{Im}(b)|}{2} \|u\|_{L^2(\omega)}^2 + \|F\|_{L^\infty(\omega^c)} \|u\|_{L^1(\omega^c)}. \end{aligned}$$

Recalling that when $|\omega| < |\Omega|$, $-\alpha |\operatorname{Im}(a)| + \frac{\beta}{2} |\operatorname{Im}(b)| > \|F\|_{L^\infty(\Omega)}$, the above estimate yields

$$\left(|\operatorname{Im}(b)| \|u\|_{L^2(\omega)}^{1-m} - 2|\operatorname{Im}(a)| |\Omega|^{\frac{1-m}{2}} \right) \|u\|_{L^2(\omega)}^{m+1} + \beta |\operatorname{Im}(b)| \|u\|_{L^1(\omega^c)} \leq \frac{1}{|\operatorname{Im}(b)|} \|F\|_{L^2(\omega)}^2. \quad (4.10)$$

If $|\operatorname{Im}(b)| \|u\|_{L^2(\omega)}^{1-m} - 2|\operatorname{Im}(a)| |\Omega|^{\frac{1-m}{2}} \leq 1$ then

$$\|u\|_{L^2(\omega)} \leq C(\|F\|_{L^2(\Omega)}, |\Omega|, |a|, |b|, m) \stackrel{\text{not.}}{=} C_0, \quad (4.11)$$

and it follows from (4.5), (4.2), (4.11) and Hölder's inequality that,

$$\begin{aligned} (\beta |\operatorname{Im}(b)| - \alpha |\operatorname{Im}(a)|) \|u\|_{L^1(\omega^c)} &\leq C(C_0) + \|F\|_{L^\infty(\omega^c)} \|u\|_{L^1(\omega^c)} \\ &\leq C(C_0) + \left(\frac{\beta}{2} |\operatorname{Im}(b)| - \alpha |\operatorname{Im}(a)| \right) \|u\|_{L^1(\omega^c)}, \end{aligned}$$

so that,

$$\beta \|u\|_{L^1(\omega^c)} \leq C(\|F\|_{L^2(\Omega)}, |\Omega|, |a|, |b|, m) \stackrel{\text{not.}}{=} C_1. \quad (4.12)$$

But if $|\operatorname{Im}(b)| \|u\|_{L^2(\omega)}^{1-m} - 2|\operatorname{Im}(a)| |\Omega|^{\frac{1-m}{2}} > 1$ then (4.11) and (4.12) come from (4.10).

Finally, by (4.4), (4.8), (4.9), (4.11) and (4.12), one obtains

$$\|\nabla u\|_{L^2(\Omega)}^2 \leq |\operatorname{Re}(a)| C_{\mathbb{P}}^{m+1} |\Omega|^{\frac{1-m}{2}} \|\nabla u\|_{L^2(\Omega)}^{m+1} + C(C_0, C_1) + \frac{C_{\mathbb{P}}^2}{2} \|F\|_{L^2(\Omega)}^2 + \frac{1}{2} \|\nabla u\|_{L^2(\Omega)}^2.$$

It follows that $(\|\nabla u\|_{L^2(\Omega)}^{1-m} - C) \|\nabla u\|_{L^2(\Omega)}^{m+1} \leq C + C_{\mathbb{P}}^2 \|F\|_{L^2(\Omega)}^2$, from which we easily deduce (4.7).

Step 3. Proof of (4.7) with Assumption 3).

By Assumption 3), (4.1), (4.3) and (4.9)

$$\|\nabla u\|_{L^2(\Omega)}^2 \leq C \|\nabla u\|_{L^2(\Omega)}^{m+1} + \left(|\operatorname{Re}(b)| C_{\mathbb{P}}^2 + \frac{C_{\mathbb{P}}^2}{2\mu^2} \right) \|\nabla u\|_{L^2(\Omega)}^2 + \frac{\mu^2}{2} \|F\|_{L^2(\Omega)}^2,$$

where $C = C(|\Omega|, |a|, N, m)$. We then deduce,

$$\left(\left(1 - |\operatorname{Re}(b)|C_{\mathbb{P}}^2 - \frac{C_{\mathbb{P}}^2}{2\mu^2} \right) \|\nabla u\|_{L^2(\Omega)}^{1-m} - C \right) \|\nabla u\|_{L^2(\Omega)}^{m+1} \leq \frac{\mu^2}{2} \|F\|_{L^2(\Omega)}^2.$$

Since $|\operatorname{Re}(b)| < C_{\mathbb{P}}^{-2}$, there exists $\mu_0 > 0$ such that $C_2 \stackrel{\text{def.}}{=} 1 - |\operatorname{Re}(b)|C_{\mathbb{P}}^2 - \frac{C_{\mathbb{P}}^2}{2\mu_0^2} > 0$. For such a μ_0 , $\left(C_2 \|\nabla u\|_{L^2(\Omega)}^{1-m} - C \right) \|\nabla u\|_{L^2(\Omega)}^{m+1} \leq \frac{\mu_0^2}{2} \|F\|_{L^2(\Omega)}^2$, from which (4.7) follows. \square

Corollary 4.3. *Let $(\Omega_n)_{n \in \mathbb{N}}$ a sequence of open subsets of \mathbb{R}^N be such that $\sup_{n \in \mathbb{N}} |\Omega_n| < \infty$, let $0 < m < 1$, let $(a, b) \in \mathbb{C}^2$ and let $(F_n)_{n \in \mathbb{N}} \subset L^\infty(\Omega_n)$ be such that $\sup_{n \in \mathbb{N}} \|F_n\|_{L^2(\Omega_n)} < \infty$. If $\operatorname{Re}(b) < 0$ then assume further that $\operatorname{Im}(b) \neq 0$ or $-\frac{1}{C_{\mathbb{P}}^2} < \operatorname{Re}(b)$, where $C_{\mathbb{P}}$ is the constant in (4.1). Let $(u_\ell^n)_{(n, \ell) \in \mathbb{N}^2} \subset H_0^1(\Omega_n)$ be a sequence satisfying*

$$\forall n \in \mathbb{N}, \forall \ell \in \mathbb{N}, -\Delta u_\ell^n + f_\ell(u_\ell^n) = F_n, \text{ in } L^2(\Omega_n), \quad (4.13)$$

where for any $\ell \in \mathbb{N}$,

$$\forall u \in L^2(\Omega_n), f_\ell(u) = \begin{cases} a|u|^{-(1-m)}u + bu, & \text{if } |u| \leq \ell, \\ a\ell^m \frac{u}{|u|} + b\ell \frac{u}{|u|}, & \text{if } |u| > \ell. \end{cases} \quad (4.14)$$

Then there exists a diagonal extraction $(u_{\varphi(n)}^n)_{n \in \mathbb{N}}$ of $(u_\ell^n)_{(n, \ell) \in \mathbb{N}^2}$ such that the following estimate holds.

$$\forall n \in \mathbb{N}, \|u_{\varphi(n)}^n\|_{H_0^1(\Omega_n)} \leq C,$$

where $C = C\left(\sup_{n \in \mathbb{N}} \|F_n\|_{L^2(\Omega_n)}, \sup_{n \in \mathbb{N}} |\Omega_n|, |a|, |b|, N, m\right)$.

Proof. Choosing u_ℓ^n and iu_ℓ^n as test functions, we get

$$\begin{aligned} \|\nabla u_\ell^n\|_{L^2(\Omega_n)}^2 + \operatorname{Re}(a) \left(\|u_\ell^n\|_{L^{m+1}(\{|u_\ell^n| \leq \ell\})}^{m+1} + \ell^m \|u_\ell^n\|_{L^1(\{|u_\ell^n| > \ell\})} \right) \\ + \operatorname{Re}(b) \left(\|u_\ell^n\|_{L^2(\{|u_\ell^n| \leq \ell\})}^2 + \ell \|u_\ell^n\|_{L^1(\{|u_\ell^n| > \ell\})} \right) = \operatorname{Re} \int_{\Omega_n} F_n \overline{u_\ell^n} dx, \end{aligned}$$

$$\begin{aligned} \operatorname{Im}(a) \left(\|u_\ell^n\|_{L^{m+1}(\{|u_\ell^n| \leq \ell\})}^{m+1} + \ell^m \|u_\ell^n\|_{L^1(\{|u_\ell^n| > \ell\})} \right) \\ + \operatorname{Im}(b) \left(\|u_\ell^n\|_{L^2(\{|u_\ell^n| \leq \ell\})}^2 + \ell \|u_\ell^n\|_{L^1(\{|u_\ell^n| > \ell\})} \right) = \operatorname{Im} \int_{\Omega_n} F_n \overline{u_\ell^n} dx, \end{aligned}$$

for any $(n, \ell) \in \mathbb{N}^2$. We first note that,

$$\forall (n, \ell) \in \mathbb{N}^2, \begin{cases} \ell^m \|u_\ell^n\|_{L^1(\{|u_\ell^n| > \ell\})} \leq \|u_\ell^n\|_{L^{m+1}(\{|u_\ell^n| > \ell\})}^{m+1}, \\ \ell \|u_\ell^n\|_{L^1(\{|u_\ell^n| > \ell\})} \leq \|u_\ell^n\|_{L^2(\{|u_\ell^n| > \ell\})}^2, \end{cases} \quad (4.15)$$

For each $n \in \mathbb{N}$, we choose $\varphi(n) \in \mathbb{N}$ large enough to have $\varphi(n)^{1-m} > 2 \frac{\|F_n\|_{L^\infty(\Omega_n)} + |\operatorname{Im}(a)|}{|\operatorname{Im}(b)|}$, when $\operatorname{Im}(b) \neq 0$ and $\varphi(n) = n$, when $\operatorname{Im}(b) = 0$. Thus for any $n \in \mathbb{N}$, as soon as $\operatorname{Im}(b) \neq 0$, one has

$$\|F_n\|_{L^\infty(\Omega_n)} < -\varphi(n)^m |\operatorname{Im}(a)| + \frac{\varphi(n)}{2} |\operatorname{Im}(b)|. \quad (4.16)$$

With help of (4.15) and (4.16), we may apply Lemma 4.1 to $u_{\varphi(n)}^n$, for each $n \in \mathbb{N}$, with $\omega = \{x \in \Omega_n; |u_{\varphi(n)}^n(x)| \leq \varphi(n)\}$, $\alpha = \varphi(n)^m$ and $\beta = \varphi(n)$. \square

Lemma 4.4. *Let $\Omega \subseteq \mathbb{R}^N$ be an open subset, let ω an open subset of \mathbb{R}^N be such that $\omega \subseteq \Omega$, let $m \geq 0$ and let $(a, b, c) \in \mathbb{C}^3$ be such that $\operatorname{Im}(b) \neq 0$. If $\operatorname{Re}(a) \leq 0$ then assume further that $\operatorname{Im}(a) \neq 0$. Let $\alpha, \beta, R \geq 0$, let $F \in L^2(\Omega)$ and let*

$$A = \begin{cases} \max \left\{ 1, \frac{1+|b|+R^2|c|}{|\operatorname{Im}(b)|}, \frac{|\operatorname{Re}(a)|}{|\operatorname{Im}(a)|} \right\}, & \text{if } \operatorname{Re}(a) \leq 0, \\ \max \left\{ 1, \frac{1+|b|+R^2|c|}{|\operatorname{Im}(b)|} \right\}, & \text{if } \operatorname{Re}(a) > 0. \end{cases}$$

If $|\omega| < |\Omega|$ then assume further that $F \in L^\infty(\Omega)$ and $\beta \geq 2A\|F\|_{L^\infty(\Omega)} + 1$. Let $u \in H^1(\Omega)$ satisfies

$$\begin{aligned} \|\nabla u\|_{L^2(\Omega)}^2 + \operatorname{Re}(a) \left(\|u\|_{L^{m+1}(\omega)}^{m+1} + \alpha \|u\|_{L^1(\omega^c)} \right) \\ - (|b| + R^2|c|) \left(\|u\|_{L^2(\omega)}^2 + \beta \|u\|_{L^1(\omega^c)} \right) \leq \int_{\Omega} |Fu| dx, \end{aligned} \quad (4.17)$$

$$|\operatorname{Im}(a)| \left(\|u\|_{L^{m+1}(\omega)}^{m+1} + \alpha \|u\|_{L^1(\omega^c)} \right) + |\operatorname{Im}(b)| \left(\|u\|_{L^2(\omega)}^2 + \beta \|u\|_{L^1(\omega^c)} \right) \leq \int_{\Omega} |Fu| dx. \quad (4.18)$$

Then there exists a positive constant $M = M(|a|, |b|, |c|)$ such that,

$$\|\nabla u\|_{L^2(\Omega)}^2 + \|u\|_{L^2(\omega)}^2 + \|u\|_{L^{m+1}(\omega)}^{m+1} + \|u\|_{L^1(\omega^c)} \leq M(R^4 + 1)\|F\|_{L^2(\Omega)}^2. \quad (4.19)$$

Proof. Let A be as in the lemma. We multiply (4.18) by A and sum the result to (4.17). This yields,

$$\|\nabla u\|_{L^2(\Omega)}^2 + A_0 \left(\|u\|_{L^{m+1}(\omega)}^{m+1} + \alpha \|u\|_{L^1(\omega^c)} \right) + \|u\|_{L^2(\omega)}^2 + \beta \|u\|_{L^1(\omega^c)} \leq 2A \int_{\Omega} |Fu| dx,$$

where $A_0 = A|\operatorname{Im}(a)| + \operatorname{Re}(a)$. Applying Hölder's inequality and (4.3), we get

$$\begin{aligned} \|\nabla u\|_{L^2(\Omega)}^2 + \|u\|_{L^2(\omega)}^2 + A_0 \|u\|_{L^{m+1}(\omega)}^{m+1} + \beta \|u\|_{L^1(\omega^c)} \\ \leq 2A\|F\|_{L^\infty(\Omega)} \|u\|_{L^1(\omega^c)} + 2A^2\|F\|_{L^2(\Omega)}^2 + \frac{1}{2}\|u\|_{L^2(\omega)}^2, \end{aligned}$$

from which we deduce the result if $|\omega| = |\Omega|$. Now, suppose $|\omega| < |\Omega|$. The above estimate leads to,

$$\|\nabla u\|_{L^2(\Omega)}^2 + \|u\|_{L^2(\omega)}^2 + A_0 \|u\|_{L^{m+1}(\omega)}^{m+1} + (\beta - 2A\|F\|_{L^\infty(\Omega)}) \|u\|_{L^1(\omega^c)} \leq 4A^2\|F\|_{L^2(\Omega)}^2,$$

from which we prove the lemma since $\beta - 2A\|F\|_{L^\infty(\Omega)} \geq 1$. \square

Lemma 4.5. *Let $(a, b) \in \mathbb{A}^2$ satisfies (2.7). Then there exists $\delta_\star = \delta_\star(|a|, |b|) \in (0, 1]$, $L = L(|a|, |b|)$ and $M = M(|a|, |b|)$ satisfying the following property. If $\delta \in [0, \delta_\star]$ and C_0, C_1, C_2, C_3, C_4 are six nonnegative real numbers satisfying*

$$|C_1 + \delta C_2 + \operatorname{Re}(a)C_3 + (\operatorname{Re}(b) - \delta)C_4| \leq C_0, \quad (4.20)$$

$$|\operatorname{Im}(a)C_3 + \operatorname{Im}(b)C_4| \leq C_0, \quad (4.21)$$

then

$$0 \leq C_1 + LC_3 + LC_4 \leq MC_0. \quad (4.22)$$

Proof. We split the proof in 4 cases. Let $\gamma > 0$ be small enough to be chosen later. Note that when $\operatorname{Im}(a)\operatorname{Im}(b) \geq 0$ then estimate (4.21) can be rewritten as

$$|\operatorname{Im}(a)|C_3 + |\operatorname{Im}(b)|C_4 \leq C_0. \quad (4.23)$$

Case 1. $\operatorname{Re}(a) \geq 0$, $\operatorname{Re}(b) \geq 0$ and $\operatorname{Im}(a)\operatorname{Im}(b) \geq 0$. We add (4.23) with (4.20) and obtain,

$$C_1 + (\operatorname{Re}(a) + |\operatorname{Im}(a)|)C_3 + (\operatorname{Re}(b) - \delta_\star + |\operatorname{Im}(b)|)C_4 \leq 2C_0.$$

Case 2. $(\operatorname{Re}(a) \geq 0, \operatorname{Re}(b) < 0 \text{ and } \operatorname{Im}(a)\operatorname{Im}(b) \geq 0)$ or $(\operatorname{Im}(a)\operatorname{Im}(b) < 0)$. Then,

$$C_1 + \frac{\operatorname{Re}(a)\operatorname{Im}(b) - \operatorname{Re}(b)\operatorname{Im}(a) + \gamma\operatorname{Im}(a)}{\operatorname{Im}(b)}C_3 + (\gamma - \delta_\star)C_4 \leq \frac{|\operatorname{Re}(b)| + |\operatorname{Im}(b)| + \gamma}{|\operatorname{Im}(b)|}C_0.$$

where we computed (4.20) $- \frac{\operatorname{Re}(b) - \gamma}{\operatorname{Im}(b)}$ (4.21).

Case 3. $\operatorname{Re}(a) < 0$, $\operatorname{Re}(b) \geq 0$ and $\operatorname{Im}(a)\operatorname{Im}(b) \geq 0$. By computing (4.20) $- \frac{\operatorname{Re}(a) - \gamma}{\operatorname{Im}(a)}$ (4.21), we get,

$$C_1 + \gamma C_3 + \left(\frac{\operatorname{Re}(b)\operatorname{Im}(a) - \operatorname{Re}(a)\operatorname{Im}(b) + \gamma\operatorname{Im}(b)}{\operatorname{Im}(a)} - \delta_\star \right) C_4 \leq \frac{|\operatorname{Re}(a)| + |\operatorname{Im}(a)| + \gamma}{|\operatorname{Im}(a)|}C_0.$$

Case 4. $\operatorname{Re}(a) < 0$, $\operatorname{Re}(b) < 0$ and $\operatorname{Im}(a)\operatorname{Im}(b) \geq 0$. Note that since $(a, b) \in \mathbb{A}^2$ then necessarily $\operatorname{Im}(a)\operatorname{Im}(b) \neq 0$. Thus, we can compute (4.20) $+ \max \left\{ \frac{|\operatorname{Re}(a)| + \gamma}{|\operatorname{Im}(a)|}, \frac{|\operatorname{Re}(b)| + \gamma}{|\operatorname{Im}(b)|} \right\}$ (4.23) and obtain,

$$C_1 + \gamma C_3 + (\gamma - \delta_\star)C_4 \leq \left(\frac{|\operatorname{Re}(a)| + |\operatorname{Im}(a)| + \gamma}{|\operatorname{Im}(a)|} + \frac{|\operatorname{Re}(b)| + |\operatorname{Im}(b)| + \gamma}{|\operatorname{Im}(b)|} \right) C_0.$$

In both cases, we may choose $\gamma > 0$ small enough to have

$$\begin{cases} \frac{\operatorname{Re}(a)\operatorname{Im}(b) - \operatorname{Re}(b)\operatorname{Im}(a) + \gamma\operatorname{Im}(a)}{\operatorname{Im}(b)} > 0, & \text{in Case 2,} \\ \frac{\operatorname{Re}(b)\operatorname{Im}(a) - \operatorname{Re}(a)\operatorname{Im}(b) + \gamma\operatorname{Im}(b)}{\operatorname{Im}(a)} > 0, & \text{in Case 3.} \end{cases}$$

Then we choose $0 < \delta_\star < \min \{1, \gamma, |\operatorname{Im}(b)| + |\operatorname{Re}(b)|\}$ such that

$$\delta_\star < \frac{\operatorname{Re}(b)\operatorname{Im}(a) - \operatorname{Re}(a)\operatorname{Im}(b) + \gamma\operatorname{Im}(b)}{\operatorname{Im}(a)}, \text{ in Case 3.}$$

This ends the proof. \square

Corollary 4.6. *Let $\Omega \subseteq \mathbb{R}^N$ be an open subset, let $V \in L^\infty(\Omega; \mathbb{R})$, let $0 < m < 1$ and let $(a, b, c) \in \mathbb{C}^3$ be such that $\operatorname{Im}(a) \leq 0$, $\operatorname{Im}(b) < 0$ and $\operatorname{Im}(c) \leq 0$. If $\operatorname{Re}(a) \leq 0$ then assume further that $\operatorname{Im}(a) < 0$. Let $\delta \geq 0$. Let $(F_n)_{n \in \mathbb{N}} \subset L^\infty(\Omega) \cap L^2(\Omega)$ be bounded in $L^2(\Omega)$ and let $(u_\ell^n)_{(n, \ell) \in \mathbb{N}^2} \subset H^1(\Omega) \cap L^{m+1}(\Omega)$ be a sequence satisfying*

$$\forall n \in \mathbb{N}, \forall \ell \in \mathbb{N}, -\Delta u_\ell^n + \delta u_\ell^n + f_\ell(u_\ell^n) = F_n, \text{ in } L^2(\Omega), \quad (4.24)$$

with boundary condition (1.3) or (1.4), where for any $\ell \in \mathbb{N}$,

$$\forall u \in L^2(\Omega), f_\ell(u) = \begin{cases} a|u|^{-(1-m)}u + (b - \delta)u + cV^2u, & \text{if } |u| \leq \ell, \\ a\ell^m \frac{u}{|u|} + (b - \delta)\ell \frac{u}{|u|} + cV^2\ell \frac{u}{|u|}, & \text{if } |u| > \ell. \end{cases} \quad (4.25)$$

For (1.4), Ω is assumed to have a C^1 boundary. Then there exist $M = M(\|V\|_{L^\infty(\Omega)}, |a|, |b|, |c|)$ and a diagonal extraction $(u_{\varphi(n)}^n)_{n \in \mathbb{N}}$ of $(u_\ell^n)_{(n, \ell) \in \mathbb{N}^2}$ for which,

$$\begin{aligned} \|\nabla u_{\varphi(n)}^n\|_{L^2(\Omega)}^2 + \|u_{\varphi(n)}^n\|_{L^2(\{ |u_{\varphi(n)}^n| \leq \varphi(n) \})}^2 &+ \|u_{\varphi(n)}^n\|_{L^{m+1}(\{ |u_{\varphi(n)}^n| \leq \varphi(n) \})}^{m+1} \\ &+ \|u_{\varphi(n)}^n\|_{L^1(\{ |u_{\varphi(n)}^n| > \varphi(n) \})} \leq M \sup_{n \in \mathbb{N}} \|F_n\|_{L^2(\Omega)}^2, \end{aligned}$$

for any $n \in \mathbb{N}$. The same is true if we replace the conditions on (a, b, c) by $(a, b, c) \in \mathbb{A} \times \mathbb{A} \times \{0\}$ satisfies (2.7) and $\delta \leq \delta_\star$, where δ_\star is given by Lemma 4.5. In this case, $M = M(|a|, |b|)$.

Proof. Choosing u_ℓ^n and iu_ℓ^n as test functions, we obtain

$$\begin{aligned} \|\nabla u_\ell^n\|_{L^2(\Omega)}^2 + \operatorname{Re}(a) \left(\|u_\ell^n\|_{L^{m+1}(\{ |u_\ell^n| \leq \ell \})}^{m+1} + \ell^m \|u_\ell^n\|_{L^1(\{ |u_\ell^n| > \ell \})} \right) \\ + (\operatorname{Re}(b) - \|V\|_{L^\infty(\Omega)}^2 |\operatorname{Re}(c)|) \left(\|u_\ell^n\|_{L^2(\{ |u_\ell^n| \leq \ell \})}^2 + \ell \|u_\ell^n\|_{L^1(\{ |u_\ell^n| > \ell \})} \right) \leq \operatorname{Re} \int_{\Omega} F_n \overline{u_\ell^n} dx, \end{aligned} \quad (4.26)$$

$$\begin{aligned} \operatorname{Im}(a) \left(\|u_\ell^n\|_{L^{m+1}(\{ |u_\ell^n| \leq \ell \})}^{m+1} + \ell^m \|u_\ell^n\|_{L^1(\{ |u_\ell^n| > \ell \})} \right) + \operatorname{Im}(b) \left(\|u_\ell^n\|_{L^2(\{ |u_\ell^n| \leq \ell \})}^2 + \ell \|u_\ell^n\|_{L^1(\{ |u_\ell^n| > \ell \})} \right) \\ + \operatorname{Im}(c) \left(\|Vu\|_{L^2(\{ |u_\ell^n| \leq \ell \})}^2 + \ell \|V^2u\|_{L^1(\{ |u_\ell^n| > \ell \})} \right) = \operatorname{Im} \int_{\Omega} F_n \overline{u_\ell^n} dx, \end{aligned} \quad (4.27)$$

for any $(n, \ell) \in \mathbb{N}^2$. If $(a, b, c) \in \mathbb{A} \times \mathbb{A} \times \{0\}$ satisfies (2.7), then we obtain

$$\begin{aligned} \|\nabla u_\ell^n\|_{L^2(\Omega)}^2 + \delta \|u_\ell^n\|_{L^2(\Omega)}^2 + \operatorname{Re}(a) \left(\|u_\ell^n\|_{L^{m+1}(\{ |u_\ell^n| \leq \ell \})}^{m+1} + \ell^m \|u_\ell^n\|_{L^1(\{ |u_\ell^n| > \ell \})} \right) \\ + (\operatorname{Re}(b) - \delta) \left(\|u_\ell^n\|_{L^2(\{ |u_\ell^n| \leq \ell \})}^2 + \ell \|u_\ell^n\|_{L^1(\{ |u_\ell^n| > \ell \})} \right) = \operatorname{Re} \int_{\Omega} F_n \overline{u_\ell^n} dx, \end{aligned} \quad (4.28)$$

$$\begin{aligned} \operatorname{Im}(a) & \left(\|u_\ell^n\|_{L^{m+1}(\{|u_\ell^n| \leq \ell\})}^{m+1} + \ell^m \|u_\ell^n\|_{L^1(\{|u_\ell^n| > \ell\})} \right) \\ & + \operatorname{Im}(b) \left(\|u_\ell^n\|_{L^2(\{|u_\ell^n| \leq \ell\})}^2 + \ell \|u_\ell^n\|_{L^1(\{|u_\ell^n| > \ell\})} \right) = \operatorname{Im} \int_{\Omega} F_n \overline{u_\ell^n} dx, \quad (4.29) \end{aligned}$$

for any $(n, \ell) \in \mathbb{N}^2$. For this last case, it follows from Lemma 4.5, Hölder's inequality and (4.3) that

$$\begin{aligned} \|\nabla u_\ell^n\|_{L^2(\Omega)}^2 + \frac{L}{2} \|u_\ell^n\|_{L^2(\{|u_\ell^n| \leq \ell\})}^2 + L \|u_\ell^n\|_{L^{m+1}(\{|u_\ell^n| \leq \ell\})}^{m+1} \\ + (L\ell - M\|F\|_{L^\infty(\Omega)}) \|u_\ell^n\|_{L^1(\{|u_\ell^n| > \ell\})} \leq \frac{M^2}{2L} \|F\|_{L^2(\Omega)}^2. \end{aligned}$$

Then the result follows by choosing for each $n \in \mathbb{N}$, $\varphi(n) \in \mathbb{N}$ large enough to have $L\varphi(n) - M\|F\|_{L^\infty(\Omega)} \geq 1$. Now we turn out to the case (4.26)–(4.27). Let M and A be given by Lemma 4.4 with $R = \|V\|_{L^\infty(\Omega)}$. For each $n \in \mathbb{N}$, let $\varphi(n) \in \mathbb{N}$ be large enough to have $\varphi(n) \geq 2A\|F_n\|_{L^\infty(\Omega)} + 1$, if $|\omega| < |\Omega|$ and $\varphi(n) = n$, if $|\omega| = |\Omega|$. For each $n \in \mathbb{N}$, with help of (4.26) and (4.27), we may apply Lemma 4.4 to $u_{\varphi(n)}^n$ with $\omega = \left\{x \in \Omega; \left|u_{\varphi(n)}^n(x)\right| \leq \varphi(n)\right\}$, $\alpha = \varphi(n)^m$, $\beta = \varphi(n)$ and $R = \|V\|_{L^\infty(\Omega)}$. Hence the result. \square

5 Proofs of the main results

Proof of Theorem 2.12. Property 1) follows from Proposition 4.5 in Bégout and Díaz [1] while Property 2) comes from Remark 4.7 in Bégout and Díaz [1]. It remains to establish Property 3). Assume first that $F \in L^p(\Omega)$ and $V \in \bigcap_{1 < r < \infty} L^r(\Omega)$. It follows from the equation that for any $\varepsilon \in (0, q-1)$, $\Delta u \in L^{q-\varepsilon}(\Omega)$. We now recall an elliptic regularity result. If for some $1 < s < \infty$, $u \in L^s(\Omega)$ satisfies $\Delta u \in L^s(\Omega)$ and $\gamma(\nabla u, \nu) = 0$ then $u \in W^{2,s}(\Omega)$ (Proposition 2.5.2.3, p.131, in Grisvard [11]). Since for any $\varepsilon \in (0, q-1)$, $u, \Delta u \in L^{q-\varepsilon}(\Omega)$ and $\gamma(\nabla u, \nu) = 0$ (by assumption), by following the bootstrap method of the proof p.52 of Property 1) of Proposition 4.5 in Bégout and Díaz [1], we obtain the result. Indeed, therein, it is sufficient to apply the global regularity result in Grisvard [11] (Proposition 2.5.2.3, p.131) in place of the local regularity result in Cazenave [6] (Proposition 4.1.2, p.101-102). Now, you turn out to the Hölder regularity. Assume $F \in C^{0,\alpha}(\overline{\Omega})$ and $V \in C^{0,\alpha}(\overline{\Omega})$. By global smoothness property in $W^{2,p}$ proved above, we know that $u \in W^{2,N+1}(\Omega)$ and $\gamma(\nabla u, \nu) = 0$ in $L^{N+1}(\Gamma)$. It follows from the Sobolev's embedding, $W^{2,N+1}(\Omega) \hookrightarrow C^{1, \frac{1}{N+1}}(\overline{\Omega}) \hookrightarrow C^{0,1}(\overline{\Omega})$, that for any $x \in \Gamma$, $\frac{\partial u}{\partial \nu}(x) = 0$ and $u \in C^{0,1}(\overline{\Omega})$. A straightforward calculation yields,

$$\forall (x, y) \in \overline{\Omega}^2, \left| |u(x)|^{-(1-m)}u(x) - |u(y)|^{-(1-m)}u(y) \right| \leq 5|u(x) - u(y)|^m \leq 5|x - y|^m.$$

Setting, $g = F - (a|u|^{-(1-m)}u + (b-1)u + cVu)$, we deduce that $g \in C^{0,\alpha}(\overline{\Omega})$. Let $v \in C^{2,\alpha}(\overline{\Omega})$ be the unique solution to

$$\begin{cases} -\Delta v + v = g, & \text{in } \Omega, \\ \frac{\partial v}{\partial \nu} = 0, & \text{on } \Gamma, \end{cases}$$

(see, for instance, Theorem 3.2 p.137 in Ladyzhenskaya and Ural'tseva [16]). It follows that u and v are two H^1 -solutions of the above equations and since uniqueness holds in $H^1(\Omega)$ (Lax-Milgram's Theorem), we deduce that $u = v$. Hence $u \in C^{2,\alpha}(\overline{\Omega})$. This concludes the proof². \square

Proof of Proposition 2.14. We first establish Property 1). Since Ω has $C^{0,1}$ boundary and $u \in H_0^1(\Omega)$, it follows that $\gamma(u) = 0$. Moreover, Sobolev's embedding and equation (2.9) imply that $\Delta u \in L^2(\Omega)$. We then obtain that $u \in H^2(\Omega)$ (Grisvard [11], Corollary 2.5.2.2, p.131). Hence Property 1). We turn out to Property 2). It follows from equation (2.9) that $\Delta u \in L^2(\Omega)$, so that (2.9) makes sense a.e. in Ω . Then Property 2) comes from the arguments of 2) of Remark 2.5. \square

Lemma 5.1. *Let $\mathcal{O} \subset \mathbb{R}^N$ be a bounded open subset, let $V \in L^\infty(\Omega; \mathbb{C})$, let $0 < m < 1$, let $(a, b, c) \in \mathbb{C}^3$ and let $F \in L^2(\mathcal{O})$. Let $\delta \in [0, 1]$. Then for any $\ell \in \mathbb{N}$, there exist a solution $u_\ell^1 \in H_0^1(\mathcal{O})$ to*

$$-\Delta u_\ell + \delta u_\ell + f_\ell(u_\ell) = F, \text{ in } L^2(\mathcal{O}), \quad (5.1)$$

with boundary condition (1.3) and a solution $u_\ell^2 \in H^1(\mathcal{O})$ to (5.1) with boundary condition (1.4) (in this case, \mathcal{O} is assumed to have a C^1 boundary and $\delta > 0$), where

$$\forall u \in L^2(\Omega), f_\ell(u) = \begin{cases} a|u|^{-(1-m)}u + (b-\delta)u + cV^2u, & \text{if } |u| \leq \ell, \\ a\ell^m \frac{u}{|u|} + (b-\delta)\ell \frac{u}{|u|} + cV^2\ell \frac{u}{|u|}, & \text{if } |u| > \ell. \end{cases} \quad (5.2)$$

If, in addition, V is spherically symmetric then Symmetry Property 2.2 holds.

Proof. We proceed with the proof in two steps. Let $H = H_0^1(\mathcal{O})$, in the homogeneous Dirichlet case, and $H = H^1(\mathcal{O})$, in the homogeneous Neumann case. Let $\delta \in [0, 1]$ (with additionally $\delta > 0$ and Γ of class C^1 if $H = H^1(\mathcal{O})$). Step 1 below being obvious, we omit the proof.

Step 1. $\forall G \in L^2(\mathcal{O})$, $\exists! u \in H$ s.t. $-\Delta u + \delta u = G$. Moreover, $\exists \alpha > 0$ s.t. $\forall G \in L^2(\mathcal{O})$, $\|(-\Delta + \delta I)^{-1}G\|_{H^1(\mathcal{O})} \leq \alpha \|G\|_{L^2(\mathcal{O})}$. Finally, Symmetry Property 2.2 holds.

Step 2. Conclusion.

For each $\ell \in \mathbb{N}$, we define $g_\ell = -f_\ell + F \in C(L^2(\mathcal{O}); L^2(\mathcal{O}))$. With help of the continuous and compact

²More directly, we could have said that since $u \in W^{2,N+1}(\Omega)$, $\gamma(\nabla u \cdot \nu) = 0$ and $\Delta u \in C^{0,\alpha}(\overline{\Omega})$ (by the estimate of the nonlinearity) then by Theorem 6.3.2.1, p.287, in Grisvard [11], $u \in C^{2,\alpha}(\overline{\Omega})$. But this theorem requires Ω to have a $C^{2,1}$ boundary.

embedding $i : H \hookrightarrow L^2(\mathcal{O})$ and Step 1, we may define a continuous and compact sequence of mappings $(T_\ell)_{\ell \in \mathbb{N}}$ of H as follows. For any $\ell \in \mathbb{N}$, set

$$\begin{aligned} T_\ell : H &\xrightarrow{i} L^2(\mathcal{O}) \xrightarrow{g_\ell} L^2(\mathcal{O}) \xrightarrow{(-\Delta + \delta I)^{-1}} H \\ u &\longmapsto i(u) = u \longmapsto g_\ell(u) \longmapsto (-\Delta + \delta I)^{-1}(g_\ell(u)) \end{aligned}$$

Set $\rho = 2\alpha(|a| + |b| + |c| + 1) \left(\left(\|V\|_{L^\infty(\Omega)}^2 + 2 \right) \ell |\mathcal{O}|^{\frac{1}{2}} + \|F\|_{L^2(\mathcal{O})} \right)$. Let $u \in H$. It follows that,

$$\|T_\ell(u)\|_{H^1(\mathcal{O})} = \|(-\Delta + \delta I)^{-1}(g_\ell(u))\|_{H^1(\mathcal{O})} \leq \alpha \|g_\ell(u)\|_{L^2(\mathcal{O})} \leq \rho.$$

Existence comes from the Schauder's fixed point Theorem applied to T_ℓ . The Symmetry Property 2.2 is obtained by working in H_{rad} in place of H (and in H_{even} and H_{odd} for $N = 1$). \square

Proof of Theorem 2.1. Let for any $u \in L^2(\Omega)$, $f(u) = a|u|^{-(1-m)}u + bu$. Set $\Omega_n = \Omega \cap B(0, n)$. Let $(G_n)_{n \in \mathbb{N}} \subset \mathcal{D}(\Omega)$ be such that $G_n \xrightarrow[n \rightarrow \infty]{L^2(\Omega)} F$. Let $(u_\ell^n)_{(n, \ell) \in \mathbb{N}^2} \subset H_0^1(\Omega_n)$ a sequence of solutions of (5.1) be given by Lemma 5.1 with $\mathcal{O} = \Omega_n$, $c = \delta = 0$ and $F_n = G_n|_{\Omega_n}$. We define $\widetilde{u}_\ell^n \in H_0^1(\Omega)$ by extending u_n by 0 in $\Omega \cap \Omega_n^c$. We also denote by \widetilde{f}_ℓ the extension by 0 of f_ℓ in $\Omega \cap \Omega_n^c$. By Corollary 4.3, there exists a diagonal extraction $(\widetilde{u}_{\varphi(n)}^n)_{n \in \mathbb{N}}$ of $(\widetilde{u}_\ell^n)_{(n, \ell) \in \mathbb{N}^2}$ which is bounded in $H_0^1(\Omega)$. By reflexivity of $H_0^1(\Omega)$, Rellich-Kondrachov's Theorem and converse of the dominated convergence theorem, there exist $u \in H_0^1(\Omega)$ and $g \in L_{\text{loc}}^2(\Omega; \mathbb{R})$ such that, up to a subsequence that we still denote by $(\widetilde{u}_{\varphi(n)}^n)_{n \in \mathbb{N}}$, $\widetilde{u}_{\varphi(n)}^n \xrightarrow[n \rightarrow \infty]{L_{\text{loc}}^2(\Omega)} u$, $\widetilde{u}_{\varphi(n)}^n \xrightarrow[n \rightarrow \infty]{\text{a.e. in } \Omega} u$ and $|\widetilde{u}_{\varphi(n)}^n| \leq g$, a.e. in Ω . By these two last estimates, $\widetilde{f}_{\varphi(n)}(\widetilde{u}_{\varphi(n)}^n) \xrightarrow[n \rightarrow \infty]{\text{a.e. in } \Omega} f(u)$ and $|\widetilde{f}_{\varphi(n)}(\widetilde{u}_{\varphi(n)}^n)| \leq C(g^m + g) \in L_{\text{loc}}^2(\Omega)$, a.e. in Ω . From the dominated convergence Theorem, $\widetilde{f}_{\varphi(n)}(\widetilde{u}_{\varphi(n)}^n) \xrightarrow[n \rightarrow \infty]{L_{\text{loc}}^2(\Omega)} f(u)$. Let $\varphi \in \mathcal{D}(\Omega)$. Let $n_\star \in \mathbb{N}$ be large enough to have $\text{supp } \varphi \subset \Omega_{n_\star}$. We have by (5.1),

$$\forall n > n_\star, \left\langle -i\Delta u_{\varphi(n)}^n + f_{\varphi(n)}(u_{\varphi(n)}^n) - F_n, \varphi|_{\Omega_n} \right\rangle_{\mathcal{D}'(\Omega_n), \mathcal{D}(\Omega_n)} = 0.$$

The above convergencies lead to,

$$\begin{aligned} &\langle -\Delta u + f(u) - F, \varphi \rangle_{\mathcal{D}'(\Omega), \mathcal{D}(\Omega)} \\ &= \langle -u, \Delta \varphi \rangle_{\mathcal{D}'(\Omega), \mathcal{D}(\Omega)} + \langle f(u) - F, \varphi \rangle_{\mathcal{D}'(\Omega), \mathcal{D}(\Omega)} \\ &= \lim_{n \rightarrow \infty} \langle -\widetilde{u}_{\varphi(n)}^n, \Delta \varphi \rangle_{\mathcal{D}'(\Omega), \mathcal{D}(\Omega)} + \lim_{n \rightarrow \infty} \langle \widetilde{f}_{\varphi(n)}(\widetilde{u}_{\varphi(n)}^n) - G_n, \varphi \rangle_{\mathcal{D}'(\Omega), \mathcal{D}(\Omega)} \\ &= \lim_{n \rightarrow \infty} \langle -\Delta u_{\varphi(n)}^n + f_{\varphi(n)}(u_{\varphi(n)}^n) - F_n, \varphi|_{\Omega_n} \rangle_{\mathcal{D}'(\Omega_n), \mathcal{D}(\Omega_n)} \\ &= 0. \end{aligned}$$

By density, we then obtain that $u \in H_0^1(\Omega)$ is a solution to $-\Delta u + f(u) = F$, in $L^2(\Omega)$. Finally, if F is spherically symmetric then u (obtained as a limit of solutions given by Lemma 5.1) is also spherically symmetric. For $N = 1$, this includes the case where F is an even function. \square

Proof of Theorems 2.3 and 2.9. Choosing u and iu as test functions, we obtain

$$\begin{aligned}\|\nabla u\|_{L^2(\Omega)}^2 + \operatorname{Re}(a)\|u\|_{L^{m+1}(\Omega)}^{m+1} + \operatorname{Re}(b)\|u\|_{L^2(\Omega)}^2 &= \operatorname{Re} \int_{\Omega} F\bar{u}dx, \\ \operatorname{Im}(a)\|u\|_{L^{m+1}(\Omega)}^{m+1} + \operatorname{Im}(b)\|u\|_{L^2(\Omega)}^2 &= \operatorname{Im} \int_{\Omega} F\bar{u}dx.\end{aligned}$$

Theorem 2.3 follows immediately from Lemma 4.1 applied with $\omega = \Omega$, while Theorem 2.9 is a consequence of Lemma 4.5 applied with $\delta = 0$ and (4.3). This ends the proof. \square

Proof of Theorem 2.6. Choosing u and iu as test functions, we obtain

$$\begin{aligned}\|\nabla u\|_{L^2(\Omega)}^2 + \operatorname{Re}(a)\|u\|_{L^{m+1}(\Omega)}^{m+1} + \left(\operatorname{Re}(b) - |\operatorname{Re}(c)|\|V\|_{L^\infty(\Omega)}^2\right)\|u\|_{L^2(\Omega)}^2 &\leq \int_{\Omega} |Fu|dx, \\ |\operatorname{Im}(a)|\|u\|_{L^{m+1}(\Omega)}^{m+1} + |\operatorname{Im}(b)|\|u\|_{L^2(\Omega)}^2 + |\operatorname{Im}(c)|\|Vu\|_{L^2(\Omega)}^2 &\leq \int_{\Omega} |Fu|dx.\end{aligned}$$

The theorem follows Lemma 4.4 applied with $\omega = \Omega$, $R = \|V\|_{L^\infty(\Omega)}$ and $\alpha = \beta = 0$. \square

Proof of Theorems 2.4 and 2.8. We first assume that Ω is bounded. Let $H = H_0^1(\Omega)$, in the homogeneous Dirichlet case, and $H = H^1(\Omega)$, in the homogeneous Neumann case. Let δ_* be given by Lemma 4.5 and let for any $u \in L^2(\Omega)$, $f(u) = a|u|^{-(1-m)}u + bu + cV^2u$ (with $c = 0$ in the case of Theorem 2.8). Let $(F_n)_{n \in \mathbb{N}} \subset \mathcal{D}(\Omega)$ be such that $F_n \xrightarrow[n \rightarrow \infty]{L^2(\Omega)} F$. Let $(u_\ell^n)_{(n,\ell) \in \mathbb{N}^2} \subset H$ a sequence of solutions of (5.1) be given by Lemma 5.1 with $\mathcal{O} = \Omega$, $\delta = 1$ for Theorem 2.4, $\delta = \delta_*$ for Theorem 2.8 and such F_n . By Corollary 4.6, there exists a diagonal extraction $(u_{\varphi(n)}^n)_{n \in \mathbb{N}}$ of $(u_\ell^n)_{(n,\ell) \in \mathbb{N}^2}$ which is bounded in $W^{1,1}(\Omega) \cap \dot{H}^1(\Omega)$. Let $1 < p < 2$ be such that $W^{1,1}(\Omega) \hookrightarrow L^p(\Omega)$. Then $(u_{\varphi(n)}^n)_{n \in \mathbb{N}}$ is bounded in $W^{1,p}(\Omega)$ and there exist $u \in W^{1,p}(\Omega) \cap \dot{H}^1(\Omega)$ and $g \in L^p(\Omega; \mathbb{R})$ such that, up to a subsequence that we still denote by $(u_{\varphi(n)}^n)_{n \in \mathbb{N}}$, $u_{\varphi(n)}^n \xrightarrow[n \rightarrow \infty]{L^p(\Omega)} u$, $\nabla u_{\varphi(n)}^n \rightharpoonup \nabla u$ in $(L_w^2(\Omega))^N$, as $n \rightarrow \infty$, $u_{\varphi(n)}^n \xrightarrow[n \rightarrow \infty]{\text{a.e. in } \Omega} u$, $|u_{\varphi(n)}^n| \leq g$, a.e. in Ω and $(u_{\varphi(n)}^n \mathbb{1}_{\{|u_{\varphi(n)}^n| \leq \varphi(n)\}})_{n \in \mathbb{N}}$ is bounded in $L^2(\Omega)$, where the last estimate comes from Corollary 4.6. By these three last estimates and Fatou's Lemma, $u \in L^2(\Omega)$, $f_{\varphi(n)}(u_{\varphi(n)}^n) \xrightarrow[n \rightarrow \infty]{\text{a.e. in } \Omega} f(u) - \delta u$ and $|f_{\varphi(n)}(u_{\varphi(n)}^n)| \leq C(g^m + g) \in L^p(\Omega)$, a.e. in Ω . It follows that $u \in H^1(\Omega)$. From the dominated convergence Theorem, $f_{\varphi(n)}(u_{\varphi(n)}^n) \xrightarrow[n \rightarrow \infty]{L^p(\Omega)} f(u) - \delta u$. Consider the Dirichlet boundary condition. We recall a Gagliardo-Nirenberg's inequality.

$$\forall w \in H_0^1(\Omega), \|w\|_{L^2(\Omega)}^{N+2} \leq C\|w\|_{L^1(\Omega)}^2 \|\nabla w\|_{L^2(\Omega)}^N,$$

where $C = C(N)$. In particular, C does not depend on Ω . Since $(u_{\varphi(n)}^n)_{n \in \mathbb{N}} \subset H_0^1(\Omega)$ is bounded in $W^{1,1}(\Omega) \cap \dot{H}^1(\Omega)$, it follow from the above Gagliardo-Nirenberg's inequality that $(u_{\varphi(n)}^n)_{n \in \mathbb{N}}$ is bounded in $H_0^1(\Omega)$, so that $u \in H_0^1(\Omega)$. Now, we show that $u \in H$ is a solution. Let $m_0 \in \mathbb{N}$ be large

enough to have $H^{m_0}(\Omega) \hookrightarrow L^{p'}(\Omega)$. Let $v \in \mathcal{D}(\Omega)$, if $H = H_0^1(\Omega)$ and let $v \in H^{m_0}(\Omega)$, if $H = H^1(\Omega)$. By (5.1), we have for any $n \in \mathbb{N}$,

$$\begin{aligned} \left\langle \nabla u_{\varphi(n)}^n, \nabla v \right\rangle_{L^2(\Omega), L^2(\Omega)} + \left\langle \delta u_{\varphi(n)}^n + f_{\varphi(n)} \left(u_{\varphi(n)}^n \right), v \right\rangle_{L^p(\Omega), L^{p'}(\Omega)} \\ - \langle F_n, v \rangle_{L^2(\Omega), L^2(\Omega)} = 0. \end{aligned} \quad (5.3)$$

Above convergencies lead to allow us to pass in the limit in (5.3) and by density of $\mathcal{D}(\Omega)$ in $H_0^1(\Omega)$ and density of $H^{m_0}(\Omega)$ in $H^1(\Omega)$ (see, for instance, Corollary 9.8, p.277, in Brezis [4]), it follows that

$$\forall v \in H, \langle \nabla u, \nabla v \rangle_{L^2(\Omega), L^2(\Omega)} + \langle f(u), v \rangle_{L^2(\Omega), L^2(\Omega)} = \langle F, v \rangle_{L^2(\Omega), L^2(\Omega)}.$$

This finishes the proof of the existence for Ω bounded. Approximating Ω by an exhaustive sequence of bounded sets $(\Omega \cap B(0, n))_{n \in \mathbb{N}}$, the case Ω unbounded can be treated in the same way as in the proof of Theorem 2.1. The symmetry property also follows as in the proof of Theorem 2.1. \square

Proof of Theorem 2.10. Let $u_1, u_2 \in H^1(\Omega) \cap L^{m+1}(\Omega)$ be two solutions of (1.2) such that $Vu_1, Vu_2 \in L^2(\Omega)$. We set $u = u_1 - u_2$, $f(v) = |v|^{-(1-m)}v$ and $g(v) = af(v) + bv + cV^2v$. From Lemma 9.1 in Bégout and Díaz [1], there exists a positive constant C such that,

$$C \int_{\omega} \frac{|u_1(x) - u_2(x)|^2}{(|u_1(x)| + |u_2(x)|)^{1-m}} dx \leq \langle f(u_1) - f(u_2), u_1 - u_2 \rangle_{L^{\frac{m+1}{m}}(\Omega), L^{m+1}(\Omega)}, \quad (5.4)$$

where $\omega = \{x \in \Omega; |u_1(x)| + |u_2(x)| > 0\}$. We have that u satisfies $-\Delta u + g(u_1) - g(u_2) = 0$. Choosing $v = au$ as a test function, we get

$$\operatorname{Re}(a) \|\nabla u\|_{L^2}^2 + |a|^2 \langle f(u_1) - f(u_2), u_1 - u_2 \rangle_{L^{\frac{m+1}{m}}, L^{m+1}} + \operatorname{Re}(a\bar{b}) \|u\|_{L^2}^2 + \operatorname{Re}(a\bar{c}) \|Vu\|_{L^2}^2 = 0.$$

It follows from the above estimate and (5.4) that,

$$\operatorname{Re}(a) \|\nabla u\|_{L^2}^2 + C|a|^2 \int_{\omega} \frac{|u_1(x) - u_2(x)|^2}{(|u_1(x)| + |u_2(x)|)^{1-m}} dx + \operatorname{Re}(a\bar{b}) \|u\|_{L^2}^2 + \operatorname{Re}(a\bar{c}) \|Vu\|_{L^2}^2 \leq 0,$$

which yields Property 1). Properties 2) and 3) follow in the same way. \square

Remark 5.2. It is not hard to adapt the above proof to find other criteria of uniqueness.

6 On the existence of solutions of the Dirichlet problem for data beyond $L^2(\Omega)$

In this section we shall indicate how some of the precedent results of this paper can be extended to some data F which are not in $L^2(\Omega)$ but in the more general Hilbert space $L^2(\Omega; \delta^\alpha)$, where

$\delta(x) = \text{dist}(x, \Gamma)$ and $\alpha \in (0, 1)$.

In order to justify the associated notion of solution, we start by assuming that a function u solves equation

$$-\Delta u + f(u) = F, \quad \text{in } \Omega, \quad (6.1)$$

with the Dirichlet boundary condition (1.3), $u|_{\Gamma} = 0$, and we multiply (formally) by $\overline{v(x)}\delta(x)$, with $v \in H_0^1(\Omega; \delta^\alpha)$ (the weighted Sobolev space associated to the weight $\delta^\alpha(x)$), we integrate by parts (by Green's formula) and we take the real part. Then we get,

$$\text{Re} \int_{\Omega} \nabla u \cdot \overline{\nabla v} \delta^\alpha dx + \text{Re} \int_{\Omega} \overline{v} \nabla u \cdot \nabla \delta^\alpha dx + \text{Re} \int_{\Omega} f(u) \overline{v} \delta^\alpha dx = \text{Re} \int_{\Omega} F \overline{v} \delta^\alpha dx. \quad (6.2)$$

To give a meaning to the condition (6.2), we must assume that

$$F \in L^2(\Omega; \delta^\alpha), \quad (6.3)$$

where $\|F\|_{L^2(\Omega; \delta^\alpha)}^2 = \int_{\Omega} |F(x)|^2 \delta^\alpha(x) dx$, and to include in the definition of solution the conditions

$$u \in H_0^1(\Omega; \delta^\alpha) \quad \text{and} \quad f(u) \in L^2(\Omega; \delta^\alpha). \quad (6.4)$$

The justification of the second term in (6.2) is far to be trivial and requires the use of a version of the following Hardy type inequality,

$$\int_{\Omega} |v(x)|^2 \delta^{-(2-\alpha)}(x) dx \leq C \int_{\Omega} |\nabla v(x)|^2 \delta^\alpha(x) dx, \quad (6.5)$$

which holds for some constant C independent of v , for any $v \in H_0^1(\Omega; \delta^\alpha)$ once we assume that

$$\Omega \text{ is a bounded open subset of } \mathbb{R}^N \text{ with Lipschitz boundary} \quad (6.6)$$

(see, e.g., Kufner [13] and also Drábek, Kufner and Nicolosi [10], Kufner and Opic [14], Kufner and Sánding [15] and Nečas [19]). Notice that under (6.6), we know that $\delta \in W^{1, \infty}(\Omega)$ and so

$$\left| \int_{\Omega} \overline{v} \nabla u \cdot \nabla \delta^\alpha dx \right| = \left| \int_{\Omega} (\delta^{\frac{\alpha}{2}} \nabla u) \cdot \left(\frac{\overline{v}}{\delta^{\frac{\alpha}{2}}} \nabla \delta^\alpha \right) dx \right| \leq \alpha \|\nabla \delta\|_{L^\infty(\Omega)} \|\nabla u\|_{L^2(\Omega; \delta^\alpha)} \|v\|_{L^2(\Omega; \delta^{-(2-\alpha)})} < \infty,$$

by Cauchy-Schwarz's inequality and (6.5).

Definition 6.1. Assumed (6.3), (6.6) and $\alpha \in (0, 1)$, we say that $u \in H_0^1(\Omega; \delta^\alpha)$ is a *solution* of (6.1) and (1.3) in $H_0^1(\Omega; \delta^\alpha)$ if (6.4) holds and the integral condition (6.2) holds for any $v \in H_0^1(\Omega; \delta^\alpha)$.

Remark 6.2. Notice that $H_0^1(\Omega; \delta^\alpha) \hookrightarrow L^2(\Omega)$ (by the Hardy's inequality (6.5) and (6.6)). Moreover, since

$$\delta^{-s\alpha} \in L^1(\Omega), \text{ for any } s \in (0, 1), \quad (6.7)$$

we know (Drábek, Kufner and Nicolosi [10], p.30) that

$$H_0^1(\Omega; \delta^\alpha) \hookrightarrow W^{1,p_s}(\Omega), \text{ with } p_s = \frac{2s}{s+1}.$$

Remark 6.3. Obviously, there are many functions F such that $F \in L^2(\Omega; \delta^\alpha) \setminus L^2(\Omega)$ (for instance, if $F(x) \sim \frac{1}{\delta(x)^\beta}$, for some $\beta > 0$, then $F \in L^2(\Omega; \delta^\alpha)$, if $\beta < \frac{\alpha+1}{2}$ but $F \notin L^2(\Omega)$, once $\beta \geq \frac{1}{2}$). This fact is crucial when the nonlinear term $f(u)$ involves a singular term of the form as in (1.2) but with $m \in (-1, 0)$ (see Díaz, Hernández and Rakotoson [8] for the real case).

Remark 6.4. We point out that in most of the papers dealing with weighted solutions of semilinear equations, the notion of solution is not justified in this way but merely by replacing the Laplace operator by a bilinear form which becomes coercive on the space $H_0^1(\Omega; \delta^\alpha)$. The second integral term in (6.2) is not mentioned (since, formally, the multiplication of the equation is merely by $v \in H_0^1(\Omega; \delta^\alpha)$) but then it is quite complicated to justify that such alternative solutions satisfy the pde equation (1.2) when they are assumed, additionally, that $\Delta u \in L_{\text{loc}}^2(\Omega)$. We also mention now (although it is a completely different approach) the notion of $L^1(\Omega; \delta)$ -very weak solution developed recently for many scalars semilinear equations: see, e.g., Brezis, Cazenave, Martel and Ramiandrisoa [5], Díaz and Rakotoson [9] and the references therein).

By using exactly the same *a priori* estimates, but now adapted to the space $H_0^1(\Omega; \delta^\alpha)$, we get the following result.

Theorem 6.5. *Let Ω be a bounded open subset with Lipschitz boundary, $V \in L^\infty(\Omega; \mathbb{R})$, $0 < \alpha < 1$, $0 < m < 1$, $(a, b, c) \in \mathbb{C}^3$ as in Theorem 2.4 and let $F \in L^2(\Omega; \delta^\alpha)$. Then we have the following result.*

- 1) *There exists at least a solution $u \in H_0^1(\Omega; \delta^\alpha)$ to (1.2). Furthermore, any such solution belongs to $H_{\text{loc}}^2(\Omega)$.*
- 2) *If, in addition, we assume the conditions of Theorem 2.10, this solution is unique in the class of $H_0^1(\Omega; \delta^\alpha)$ -solutions.*

Remark 6.6. In the proof of the *a priori* estimates, it is useful to replace the weighted function δ by a more smooth function having the same behavior near Γ . This is the case, for instance of the first

eigenfunction φ_1 of the Laplace operator,

$$\begin{cases} -\Delta\varphi_1 = \lambda_1\varphi_1, & \text{in } \Omega, \\ \varphi_1|_{\Gamma} = 0, & \text{on } \Gamma. \end{cases}$$

It is well-known that $\varphi_1 \in W^{2,\infty}(\Omega) \cap W_0^{1,\infty}(\Omega)$ and that $C_1\delta(x) \leq \varphi_1(x) \leq C_2\delta(x)$, for any $x \in \Omega$, for some positive constants C_1 and C_2 , independent of x . Now, with this new weighted function, it is easy to see that the second term in (6.2) does not play any important role since, for instance, when taking $v = u$ as test function, we get that

$$\begin{aligned} \operatorname{Re} \int_{\Omega} \bar{u} \nabla u \cdot \nabla \varphi_1^\alpha dx &= \frac{1}{2} \int_{\Omega} \nabla |u|^2 \cdot \nabla \varphi_1^\alpha dx = -\frac{1}{2} \int_{\Omega} |u|^2 \Delta \varphi_1^\alpha dx \\ &= \frac{\alpha\lambda_1}{2} \int_{\Omega} |u|^2 \varphi_1^\alpha dx + \frac{\alpha(1-\alpha)}{2} \int_{\Omega} |u|^2 \varphi_1^{-(2-\alpha)} |\nabla \varphi_1|^2 dx \geq 0. \end{aligned}$$

7 Conclusions

In this section, we summarize the results obtained in Section 2 and give some applications.

The next result comes from Theorems 2.1, 2.3 and 2.10.

Theorem 7.1. *Let Ω an open subset of \mathbb{R}^N be such that $|\Omega| < \infty$ and assume $0 < m < 1$, $(a, b) \in \mathbb{C}^2$ and $F \in L^2(\Omega)$. Assume that $\operatorname{Re}(b) > -\frac{1}{C_P}$ or $\operatorname{Im}(b) \neq 0$, where C_P is the Poincaré's constant in (4.1). Then there exists at least a solution $u \in H_0^1(\Omega)$ to*

$$-\Delta u + a|u|^{-(1-m)}u + bu = F, \text{ in } L^2(\Omega). \quad (7.1)$$

Furthermore, $\|u\|_{H_0^1(\Omega)} \leq C(\|F\|_{L^2(\Omega)}, |\Omega|, |a|, |b|, N, m)$. Finally, if $\vec{a} \cdot \vec{b} > 0$ then the solution is unique.

In the above theorem, the complex numbers a and b are seen as vectors \vec{a} and \vec{b} of \mathbb{R}^2 . Consequently, $\vec{a} \cdot \vec{b}$ denotes the scalar product between these vectors of \mathbb{R}^2 .

The novelty of Theorem 7.1 is about the range of (a, b) : we obtain existence of solution with, for instance, $(a, b) \in \mathbb{R}_- \times (-\varepsilon, 0)$, with $\varepsilon > 0$ small enough, or $(a, b) = (-1 + i, -1 - i)$. Recall that, up to today, existence was an open question when $(a, b) \in \mathbb{R}_- \times \mathbb{R}_-$ or $[a, b] \cap \mathbb{R}_- \times i\{0\} \neq \emptyset$ (Bégout and Díaz [1]). Knowing that for such (a, b) equation (7.1) admits solutions, it would be interesting if, whether or not, solutions with compact support exist, as in Bégout and Díaz [1].

By Theorems 2.4, 2.6 and 2.10, we get the following result.

Theorem 7.2. *Let $\Omega \subseteq \mathbb{R}^N$ be a bounded open subset, let $0 < m < 1$ and let $(a, b, c) \in \mathbb{C}^3$ be such that $\text{Im}(a) < 0$, $\text{Im}(b) < 0$ and $\text{Im}(c) \leq 0$. For any $F \in L^2(\Omega)$, there exists at least a solution $u \in H^1(\Omega)$ to*

$$-\Delta u + a|u|^{-(1-m)}u + bu + c|x|^2u = F, \text{ in } L^2(\Omega), \quad (7.2)$$

with boundary condition (1.3) or (1.4)¹. Furthermore,

$$\|u\|_{H^1(\Omega)} \leq C(|a|, |b|, |c|)(R^2 + 1)\|F\|_{L^2(\Omega)},$$

where $B(0, R) \supset \Omega$. Finally, if $\vec{a} \cdot \vec{b} > 0$ and $\vec{a} \cdot \vec{c} > 0$ then the solution is unique.

Since, now, we are able to show that equation (7.2) admits solutions, we can study the propagation support phenomena. Indeed, we can show that, under some suitable conditions, there exists a self-similar solution u to

$$iu_t + \Delta u = a|u|^{-(1-m)}u + f(t, x), \text{ in } \mathbb{R}^N,$$

such that for any $t > 0$, $\text{supp } u(t)$ is compact (see Bégout and Díaz [3]).

Now, we turn out to equation (7.1) by extending some results found in Bégout and Díaz [1]. These results are due to Theorems 2.8, 2.9 and 2.10.

Theorem 7.3. *Let $\Omega \subseteq \mathbb{R}^N$ be an open subset of \mathbb{R}^N , let $0 < m < 1$ and let $(a, b) \in \mathbb{A}^2$ satisfies (2.7). For any $F \in L^2(\Omega)$, there exists at least a solution $u \in H^1(\Omega) \cap L^{m+1}(\Omega)$ to*

$$-\Delta u + a|u|^{-(1-m)}u + bu = F, \text{ in } L^2(\Omega) + L^{\frac{m+1}{m}}(\Omega), \quad (7.3)$$

with boundary condition (1.3) or (1.4)¹ (in this last case, Ω is assumed bounded). Furthermore,

$$\|u\|_{H^1(\Omega)}^2 + \|u\|_{L^{m+1}(\Omega)}^{m+1} \leq M(|a|, |b|)\|F\|_{L^2(\Omega)}^2.$$

Finally, if $\vec{a} \cdot \vec{b} > 0$ then the solution is unique.

When $|\Omega| < \infty$, Theorem 7.3 is an improvement of Theorem 4.1 of Bégout and Díaz [1], since we may choose $F \in L^2(\Omega)$, instead of $F \in L^{\frac{m+1}{m}}(\Omega)$ and that $L^{\frac{m+1}{m}}(\Omega) \subsetneq L^2(\Omega)$. In addition, this existence result extends to the homogeneous Neumann boundary condition. In this context, we may show three kinds of new results, under assumptions of Theorem 7.3.

- If $\Omega = \mathbb{R}^N$ and if $F \in L^2(\mathbb{R}^N)$ has compact support then equation (7.3) admits solutions and any solution is compactly supported.

- If $\|F\|_{L^2(\Omega)}$ is small enough and if F has compact support then equation (7.3) admits solutions with the homogeneous Dirichlet boundary condition and any solution is compactly supported in Ω .

- If $\|F\|_{L^2(\Omega)}$ is small enough, if $\vec{a} \cdot \vec{b} > 0$ and if F has compact support then equation (7.3) admits a unique solution with the homogeneous Neumann boundary condition and, in fact, this solution is compactly supported in Ω .

For more details, see Bégout and Díaz [3]. Finally, in Section 6 we extended our techniques of proofs to the case in which the datum F is very singular near the boundary of Ω but still is in some weighted Lebesgue space (see Theorem 6.5).

Acknowledgements

The first author is very grateful to Professor Thierry Cazenave for helpful comments about the presentation of this paper and both authors thank the anonymous referee for stimulating remarks.
